Citizen Solutions — With or	Without Help, Per Identity Status and Condition (companion to Worst_Outcomes_All_Solutions_Pareto.xlsx)
What this file is	The citizen-level companion to the master file: the same 54 core problems (18 fields x Past/Now/Future), each with the solution a citizen can execute WITHOUT any institutional help, the solution WITH help (the specific routes to claim), and the pro
What the percentages mea	The chance that a citizen or household following the path substantially solves or safely survives the problem AT THEIR OWN SCALE (household and community). Citizens do not personally fix national grids or climate tipping points; the honest row
Counts	54 playbook rows; 22 identity statuses; 18 conditions; 12 Pareto vital actions under limited resources in 4 cost tiers; 13 problems flagged as not solvable alone (citizen-only probability 30% or less) with the minimum help named.
Global scope	Statuses and conditions are enumerated globally (stateless persons, IDPs, caste, occupation, criminalized identities, restrictive regimes), not only Canadian categories. Program examples are named where a real program exists (many Canadian, b
Reading order under scarci	If resources are limited, read the PARETO sheet first: it sequences the $0 actions before the costly ones and states what each action unlocks.

#	Field of Discipline	Timefram	Worst Possible Problem	Solve It WITHOUT Help (citizen only)	Solve It WITH Help (routes to claim)	Success % —	Success % —	How to Maximize (detailed)
1	Water	Past	Regional aquifer and river systems collapse from overuse and contamination, making whole regions uninhabitable.	Store and treat your own: 56 L per person reserve, rain catchment where legal, boiling + cloth/sand filtration, wells and cisterns shared at street level; map every local source (springs, rivers, public taps) before you need it.	Register with municipal relief distribution points; claim water trucking and purification tablets through local government and relief NGOs; organize street-level delegations to demand extraction records — collective claims get answered, individual ones get queued.	55%	80%	Meter 100% of extraction; publish the balance monthly; set the cap before the crisis decade, not during it.
2	Water	Now	Municipal supply contamination or infrastructure failure cuts safe drinking water to a city.	Run your household barrier: stored 72-hour water (12 L/person drinking), a certified filter, and a full bathtub filled at the first advisory notice; never wait for official confirmation to switch to stored water.	Claim bottled-water distribution, boil-advisory notifications, and bill relief from the utility; report symptoms to public health (your report is evidence that triggers wider testing); tenant groups can compel landlords to provide potable water during outages in most jurisdictions.	70%	88%	Test household filters and stored water quarterly; utilities drill a full plant-loss weekend annually; keep 72-hour reserves rotated, not forgotten.
3	Water	Future	Multi-year megadrought plus population growth makes current cities structurally water-short.	Cut your household demand (efficient fixtures, greywater for plants where legal), store deeper (30 days), and join or form a community water cooperative that owns storage and a well collectively.	Claim your lifeline block (subsidized minimum water) where it exists; vote and organize for reuse infrastructure and extraction caps; mutual-aid federations across neighbourhoods negotiate with utilities as a bloc.	30%	58%	Start reuse infrastructure 10 years before projected shortfall; lock the lifeline-block pricing in law early; model demand on the worst decade, not the average.
4	Food & Agriculture	Past	Single-crop dependence plus blight or drought produces famine at national scale.	The household survival stack: garden + preserved staples + seed saving + reciprocal labour exchanges with neighbours; families that stored 90 days of staples and grew even 20% of calories historically outlasted famines that killed the unprepared.	Claim relief kitchens, church/mosque/temple food programs, and grain distributions; mutual-aid societies and diaspora remittances were the historical lifelines — join them before the crisis, not during it.	50%	74%	Enforce the 25% single-source ceiling in law; audit reserves physically twice a year; keep 3 seed varieties minimum per staple, germination-tested.
5	Food & Agriculture	Now	Supply-chain shock (war, fuel, fertilizer, port failure) spikes prices and empties shelves within weeks.	Buy staples in bulk with neighbours (a buying club cuts prices 15–30%), cook from base ingredients, keep the 30-day buffer rotated, and grow the highest-value items (herbs, greens, sprouts) in any available space.	Food banks and community fridges (no status questions at most), school meal programs, subsidized markets, benefits top-ups for food costs, tenant and union hardship funds; ask — most programs are under-claimed by eligible people.	62%	82%	Dual-source every staple in peacetime contracts; hold the 30-day buffer physically, not as paper claims; pre-sign emergency import routes.
6	Food & Agriculture	Future	Climate-shifted growing zones plus soil loss cut yields across several breadbaskets simultaneously.	Community land trusts and garden cooperatives that own growing space permanently; seed libraries; preservation skills (canning, fermenting, drying) spread deliberately through the neighbourhood.	Claim agricultural support as a cooperative (grants and land access go to organizations, not individuals); municipal food-policy councils are open to citizens in many cities — a seat there is a lever on the whole local system.	28%	55%	Begin soil programs a decade early; breed for the 2050 climate now; protect pollinator corridors before pollinator collapse, not after.
7	Health & Medicine	Past	Pandemic disease sweeps a population with no immunity, no germ theory, and no surge capacity.	Household hygiene discipline (boiled water, isolation of the sick in one room, burial precautions), mutual-aid nursing rosters, and quarantine of arrivals — communities that did this in 1918 measurably lowered their death rates.	Public health orders, charity hospitals, military and relief medical corps; later: vaccination programs — claim every free campaign dose for every family member the day it is offered.	45%	76%	Fund the platform in peacetime (idle capacity is the premium, not waste); drill sequence-to-dose annually; wastewater surveillance never switched off.
8	Health & Medicine	Now	Antimicrobial resistance quietly returns routine infections and surgeries to pre-antibiotic risk.	Do not self-medicate with antibiotics; complete prescribed courses; keep vaccinations current (the cheapest survival technology in this file); maintain the household kit (thermometer, oximeter, ORS, 2 weeks of fever medication).	Public clinics and vaccination programs; pharmacy benefit and drug-coverage programs for low income; hospital charity-care policies (often unadvertised — ask the billing office directly); telehealth lines for triage before paying for private care.	58%	80%	Close the agricultural loophole; tie hospital funding to published resistance rates; fund the subscription antibiotic pipeline internationally.
9	Health & Medicine	Future	An engineered or novel pathogen, or total care-system overload from aging plus chronic disease, breaks medicine as an institution.	Ventilate your spaces (open windows, CO2 awareness, a DIY or bought HEPA unit for the sick room), mask in surges without waiting for mandates, and keep medical records on paper at home.	Claim public screening, vaccination, and surge care; join patient and community health organizations — during system overload, organized groups with lists get allocations that isolated individuals do not.	35%	57%	Layer at least 3 independent defences (air, screening, surge); keep the reserve clinical workforce registered and drilled; never let occupancy exceed 85% as the normal state.
10	Energy	Past	Fuel embargo or supply cutoff paralyzes transport, heating, and industry in dependent nations.	Fuel discipline: one heated room, layered clothing, communal cooking, and fuel stockpiling in autumn; households that treated energy as a stored resource survived embargo winters that broke just-in-time households.	Fuel subsidies, ration entitlements, and communal warming spaces through municipalities and relief organizations; pensioner and disability energy supplements exist in many states — claim them every year, they are not automatic everywhere.	55%	78%	Hold reserves physically audited; pre-write the rationing tiers in law; cut demand 2% per year so the reserve covers more each year.
11	Energy	Now	Grid failure — storm, cyberattack, or cascading overload — blacks out regions for days, and everything else fails with it.	The 72-hour household standard: 1–3 kWh battery, LED lighting, safe alternative cooking, fridge discipline (open rarely, it holds cold 24–48 h closed), and knowing which neighbours have medical power needs.	Utility hardship programs and disconnection protections (winter moratoria in many jurisdictions), generator and hotel support during declared emergencies, and compensation claims for utility-caused losses — file them, with photos and receipts.	68%	84%	Drill black-start twice yearly under real load; test facility generators monthly; harden the cascading 20% of lines first (Pareto).
12	Energy	Future	Electrification of everything concentrates all risk on one system; a solar storm or systemic cyber event takes it down continent-wide for months.	Join a community solar or energy cooperative — ownership converts you from price-taker to shareholder; insulate your home first (the cheapest stored energy is heat not lost).	Claim retrofit grants and cooperative shares through public programs; energy ombudsmen exist in many countries and resolve billing and disconnection disputes free — an underused route.	32%	56%	Buy the long-lead spares in peacetime budgets; keep analogue fallbacks drilled, not documented only; distribute 30% survival-core generation locally.
13	Shelter & Housing	Past	Fire, earthquake, or war destroys a city's housing stock in days, leaving populations in the open.	Mutual rebuilding: barn-raising norms, kin networks, and staying with family across regions; keep certified copies of property and identity documents on your person — rebuilding claims die without paper.	Relief shelter systems, requisitioned housing, and reconstruction grants; register losses immediately and in writing — late registration is the most common reason legitimate claims fail.	48%	74%	Retrofit the deadliest 20% of stock first; enforce codes on occupancy, not just construction; shelter capacity pre-sited and pre-supplied.
14	Shelter & Housing	Now	Housing costs detach from incomes; working households are priced out, homelessness becomes structural.	Know your jurisdiction's tenant rights cold (eviction process, notice periods, repair duties) — illegal evictions succeed mainly when tenants don't know or can't prove the law; document everything with dated photos; share housing deliberately (co-housing, multi-generational) to cut the cost floor.	Legal aid and tenant unions (free, and they win a large share of cases they take), rent banks and eviction-prevention funds, housing benefits and supplements, shelter systems as the last rung; in Canada: 211 connects to all of these by phone, free, in many languages.	55%	78%	Automatic triggers (ratio-based zoning release) remove the annual political fight; lease public land instead of selling; measure and publish the rent-to-income ratio quarterly.
15	Shelter & Housing	Future	Climate migration plus uninsurable regions strand populations in housing that cannot be sold, insured, or safely occupied.	Don't hold all your wealth in one climate-exposed property; if you own in a risk zone, sell into strength early or insure fully; renters: prioritize buildings outside flood/fire zones when choosing.	Claim buyout and relocation programs when offered (early offers are the generous ones); disaster insurance and public reinsurance schemes; organized community land trusts that take housing permanently off the speculative market.	30%	54%	Collect the risk levy while values remain; sign receiving-city compacts early; stop new building in 30-year uninsurable zones immediately.
16	Security & Defense	Past	Invasion or civil war destroys the state's monopoly on force; civilians face violence with no protection.	Evacuation early (the families that left at the first indicator survived at far higher rates than those who waited for certainty), documentation of crimes with copies held abroad, and neighbourhood watch-and-warn networks.	Asylum and refugee protection under the 1951 Convention — claim it in the first safe country with your documents and a consistent, recorded account; diaspora and faith networks fund legal help and reception.	25%	55%	Act on the first two indicators, not the tenth; keep exit routes and records as standing household practice in at-risk regions; international triggers automatic, not negotiated mid-crisis.
17	Security & Defense	Now	Organized crime, gang fragmentation, and everyday violence make districts unsafe while institutions lose legitimacy.	Situational discipline: lit routes, varied routines where targeted, evidence habits (record, back up off-device, report in writing), and neighbourhood mutual-aid rosters with agreed check-in signals.	Police reports filed in writing (keep the report number), victim compensation funds, protective orders through legal aid, community mediation services, and focused-deterrence programs that citizens can formally request for their district.	52%	76%	Keep the target list small and evidence-based; deliver the services offer genuinely; audit civil-rights compliance monthly so legitimacy survives.
18	Security & Defense	Future	Autonomous weapons and cheap drones make precision violence available to anyone, overwhelming policing built for human-speed threats.	Hardening is institutional, but citizens control the demand side: refuse to attend venues without visible security standards, support drone-regulation and autonomous-weapons-ban campaigns with specific asks, and keep personal data footprints small (less targeting surface).	Claim protection through regulators and representatives with documented incident patterns; insurers increasingly fund community counter-drone and hardening measures for public venues — pressure flows through liability.	25%	52%	Mandate remote ID and geofencing at point of sale now; annual red-team tests for critical sites; write the legal rules of engagement before the first mass incident.
19	Governance & Law	Past	Constitutional order collapses into dictatorship through legal steps, emergency decrees, and captured courts.	Keep your own archive: certified copies of identity, property, and qualifications held by you and by trusted people in other jurisdictions; quiet non-compliance networks and emigration of assets and children were the historical hedges that worked.	International attention is a real shield: documented cases filed with foreign press, diaspora organizations, and international bodies raised the cost of persecution measurably in case after case.	30%	52%	Distribute appointment power across 3+ bodies; keep citizens' own copies of identity and property records; rehearse constitutional defence in civil society, not just courts.
20	Governance & Law	Now	Institutional corruption and state capture hollow out services while keeping the forms of democracy.	Use the transparency machinery: access-to-information requests (cheap or free in most democracies), ombudsmen, auditors — and keep receipts of every interaction with the state, in writing, dated.	Anti-corruption hotlines, whistleblower protections, public-interest law firms, and investigative journalism funds; collective complaints (a street, a union, a congregation) are investigated at rates individual ones are not.	45%	68%	Make publication the default state of every record; fix audit budgets by formula; protect whistleblowers with recovery shares, not just promises.
21	Governance & Law	Future	Legitimacy collapse: populations stop believing any institution, and coordination itself fails even without a dictator.	Build verification habits and local institutions you can personally check: attend or join citizen assemblies, participatory budgets, and municipal boards — trust is rebuilt at the scale where people can verify outcomes with their own eyes.	Claim seats: sortition assemblies, school boards, and co-op boards are open to ordinary citizens in most democracies and are chronically under-contested; small organized groups win them routinely.	28%	50%	Start with services people can verify personally (wait times, fix rates); give lottery assemblies real, bounded decisions; publish the trust metrics and act on them visibly.
22	Economy & Finance	Past	Banking panic and deflation spiral convert a market crash into a decade of mass unemployment.	Convert savings out of failing banks early, hold some value in durable goods and skills, diversify across currencies and custodians, and keep debts small — in deflations, the debt-free survived and the leveraged were wiped out regardless of income.	Deposit insurance claims, relief employment programs, and debt moratoria when declared; credit unions and mutual societies historically protected small savers better than speculative banks — membership is a peacetime decision.	45%	72%	Pre-fund the insurance; write resolution law in peacetime; keep household reserves inside insured limits across institutions.
23	Economy & Finance	Now	Asset bubbles, household debt, and cost-of-living squeeze hollow out the middle; one rate shock cascades.	The personal firewall: 3–6 months of expenses in insured deposits (split across institutions if above the insured limit), total debt payments under 30% of take-home, no variable-rate debt you could not service at +2%, and a written plan for the loss of your main income.	Consumer-protection and debt-relief law: licensed insolvency trustees give free first consultations; hardship programs at every major lender exist but must be requested; tax credits and benefits for low income are chronically under-claimed — file taxes every year even with no income, because benefits key off the return.	58%	76%	Apply the stressed-rate test (+2%) to every loan; open refinancing windows automatically when rates fall; enforce the 30% personal debt-payment ceiling.
24	Economy & Finance	Future	Automation displaces labour faster than new livelihoods form, while wealth concentrates in owners of machines and models.	Own a slice of the machines: broad index and pension participation, employee-ownership where offered, and skills weighted to the irreducibly human (care, craft, judgment, repair) — position before displacement, not after.	Claim every transition program early (retraining accounts, wage insurance) — they are rationed by application date in practice; join unions and professional bodies, which negotiate the automation terms that individuals cannot.	26%	48%	Capitalize citizen funds from automation rents early; attach benefits to persons in law now; cut standard hours in step with measured productivity, sector by sector.
25	Technology & AI	Past	A general-purpose technology spreads faster than safety norms, and its harms compound for decades before correction.	Delay adoption of unstudied exposures for non-essentials, test your home (lead, asbestos) when buying older property, and keep exposure records — compensation cases are won on records kept decades earlier.	Public testing programs, class actions, and compensation funds for industrial harms; unions and public-health agencies carry the monitoring data individuals cannot generate.	50%	70%	Attach the 30-year monitoring fund to the product, not the taxpayer; give the assessment office subpoena power over safety data; default to delay for irreversible exposures.
26	Technology & AI	Now	Cyber intrusion and ransomware shut down hospitals, pipelines, and city governments; the digital base is fragile.	The household standard, fully in your control: automatic updates on, unique passwords in a manager, MFA on email and banking first, 3-2-1 backups of irreplaceable data, and a healthy suspicion protocol for urgent messages (verify by a second channel).	Free national cyber-advice services, bank fraud departments (report within 24–48 h maximizes recovery), and police cyber-reporting portals; small organizations can claim chamber-of-commerce and insurer security audits, often free with policies.	72%	86%	Restore-test backups quarterly — an untested backup is a rumour; segment operations from office networks; 100% MFA on remote and privileged access, no exceptions.
27	Technology & AI	Future	A misaligned or misused advanced AI, or total dependence on opaque systems, produces civilizational-scale failure or harm.	Keep an analogue life-line: paper records of identity, property, and credentials; cash on hand; skills that function without connectivity; and no single platform holding the only copy of anything important.	Support and use verification infrastructure (content credentials, public model registries) and claim your rights under AI and data law where enacted — correction, explanation, and human review rights exist only for those who invoke them.	30%	52%	Register and evaluate above compute thresholds before release; drill manual modes of essential services annually; keep deployer liability absolute so caution is priced in.
28	Environment & Climate	Past	Civilizations degrade their own ecological base — soil, forests, water — until the base fails and the society follows.	Work with the land's limits: terracing, fallowing, communal grazing rules, and seed diversity were citizen-level technologies that kept soils alive for millennia where they were practiced.	Claim agricultural extension services, cooperative credit, and communal land rights in law — customary sustainable practice survives when the legal system recognizes the commons instead of enclosing it.	52%	72%	Measure the specific ecosystem's regeneration, not national averages; put soil and erosion limits in enforceable code; price restoration into products.
29	Environment & Climate	Now	Extreme heat, flood, and fire exceed the design basis of cities built for a milder century.	Your address-level defence: know your flood/heat/fire risk, a 72-hour kit, one cool room strategy (shading, night ventilation, a fan-and-wet-cloth fallback), shade trees where you have land, and documents + medications in a waterproof go-bag.	Claim cooling centres, disaster assistance (register within the deadline, with photos), insurer-funded mitigation (many insurers discount or fund shutters, backwater valves, defensible space), and municipal tree and retrofit programs.	55%	76%	Design to the 2050 worst decile, not historical weather; canopy and cooling access targets with named owners; address-level risk published so households can act.
30	Environment & Climate	Future	Tipping points cascade: ice loss, permafrost methane, ocean-circulation shifts lock in metres of sea-level rise and uninhabitable zones.	Households cannot solve tipping points; what you control is exposure: where you live, what you own there, and whether your skills and savings are portable to a safer region.	Claim migration and relocation frameworks where they exist, and organize early — communities that negotiate relocation collectively keep their cohesion and get terms; individuals fleeing alone get neither.	8%	38%	Cut emissions on the fastest feasible curve — the only causal lever; pre-negotiate migration frameworks; site all 50-year infrastructure against high-end scenarios.
31	Information & Media	Past	Propaganda systems capture whole populations; lies with state amplification prepare and excuse mass violence.	The two-source habit and the trusted-messenger network: in propaganda environments, families survived on verified word-of-mouth chains and foreign broadcasts; teach children to ask "who says, and how would they know?" before any other media skill.	Independent and public media, exile and diaspora press, and international broadcasters; support them with subscriptions and donations in peacetime — they cannot be built during the crisis.	40%	62%	Enforce ownership caps before capture, not after; teach source-tracing from age 10; sign official crisis information so it can be verified.
32	Information & Media	Now	Algorithmic feeds optimize for outrage; shared factual reality fragments; institutions cannot establish basic facts.	Personal protocol, fully effective at your scale: two independent primary sources before believing or forwarding anything alarming; read the document, not the commentary; one news window a day; leave groups that traffic in unverifiable outrage.	Public-interest and public-service media, fact-checking services, library media-literacy programs (free, in-person, in many languages), and platform reporting duties — regulators act on documented patterns, so screenshot and report coordinated campaigns.	64%	78%	Make the non-optimized feed a true default option; personal rule: two independent primary sources before acting on any alarming claim; one news window daily.
33	Information & Media	Future	Synthetic media makes any audio, video, or document forgeable at zero cost; 'seeing' stops being believing, and all records become deniable.	Keep paper originals of identity, property, and credentials; treat unsigned dramatic media as allegation; verify life-changing news through a channel you chose in advance (a person, an institution, a signed source).	Claim verification services: notaries, land registries, and courts increasingly verify by signature chain; newsrooms with content credentials are identifiable — route your trust deliberately and say why to your family, so the habit spreads.	45%	66%	Mandate content credentials in official and professional contexts; keep paper originals of identity and property documents; treat unsigned dramatic media as allegation in law.

#	Field of Discipline	Timefram	Worst Possible Problem	Solve It WITHOUT Help (citizen only)	Solve It WITH Help (routes to claim)	Success % —	Success % —	How to Maximize (detailed)
34	Psychology & Mind	Past	Mass psychological trauma — war, displacement, famine — goes untreated and transmits across generations.	Routine, ritual, work, faith practice, and mutual storytelling carried communities through collective trauma for all of history; the families that kept daily structure transmitted less damage to their children.	Claim post-crisis programs (school-based, faith-based, clinical) for children first — the evidence is strongest and the window is shortest there; community responders can be requested through public-health and relief organizations.	48%	68%	Fund the 25-year tail, not the 6-month headline; train community responders at 1:500 before crises; keep routines and schooling running as treatment infrastructure.
35	Psychology & Mind	Now	An epidemic of anxiety, depression, loneliness, and attention damage, concentrated in the young and the isolated.	The personal protocol with the strongest evidence in this file: fixed sleep window, morning light, 60 minutes of movement, one recurring in-person group weekly, and alcohol and feeds treated as dosed substances, not defaults.	Claim covered therapy and psychiatry through public systems and insurance (waitlists shorten for those who ask about cancellations and group programs), school counsellors, workplace EAPs (free, confidential, underused), and crisis lines — in Canada 988, Kids Help Phone, and Hope for Wellness for Indigenous peoples.	62%	78%	Schedule belonging like medicine (one weekly in-person group minimum); protect the sleep window; build third places as funded health infrastructure.
36	Psychology & Mind	Future	Synthetic companionship and immersive virtual worlds outcompete reality; populations withdraw from human contact, work, and reproduction.	Budget synthetic companionship like money: fixed hours, no dependency mechanics, and real-world anchors (people who expect you, places that know your name) protected in the schedule first.	Claim community infrastructure: libraries, leagues, and clubs are free and exist now; mental-health services should be asked explicitly about human-delivered care — the request itself is data the system records.	35%	55%	Budget synthetic companionship in hours and money at household level; ban dependency mechanics (jealousy, streaks, guilt) in companion products; invest in physical gathering at competing scale.
37	Education & Knowledge	Past	Knowledge monopolized or destroyed: libraries burned, literacy forbidden to classes and genders, learning dies with a generation.	Copy and carry: families and congregations that memorized, hand-copied, and hid texts preserved knowledge through every book-burning; teach children one body of knowledge by heart (it cannot be confiscated).	Claim schooling wherever any door is open (mission, charity, underground, exile schools all appear in the record), and library access in every jurisdiction you reach — a library card is obtainable by residents in most systems regardless of status.	55%	78%	Three copies, three media, three jurisdictions for all core knowledge; printed core references in every school and household; open licences so nothing can be withdrawn.
38	Education & Knowledge	Now	Schooling without learning: credentials inflate while actual literacy and numeracy stagnate or fall; misinformation outruns curricula.	Read with your children 20 minutes daily (the single highest-yield household education act), use the public library as your private university (free courses, credentials, and tutoring), and test real learning with real tasks, not grades alone.	Claim tutoring, special-needs assessment and accommodation (a legal right in most systems — request in writing), adult-literacy and language programs (free for newcomers in Canada and many countries), and open online curricula from major universities.	66%	82%	Independent published assessment per school; automatic intensive support at the age-9 reading trigger; teacher recruitment from top graduate quartiles with matching pay.
39	Education & Knowledge	Future	AI tutors and synthetic content make human knowledge optional; populations lose the ability to verify, calculate, or reason unaided.	Train the unaided skill deliberately: handwriting, mental arithmetic, navigation, essay-writing without assistance, scheduled device-free — competence you can demonstrate offline is the credential that survives system failure.	Demand dual-competence in the systems you pay for: ask schools and licensing bodies directly how unaided performance is examined; choose programs that publish the answer.	50%	68%	License critical professions on unaided competence first; regular no-device training weeks; national printed knowledge reserves maintained as infrastructure.
40	Work & Livelihood	Past	Livelihood systems collapse into serfdom, slavery, or company-town dependence: one master controls work, housing, food, and law.	Never accept the full bundle: wages in scrip, housing, food, and credit from one master is the trap — take the cash wage, live elsewhere, owe nothing to the employer, even at inconvenience.	Unions, labour inspectorates, and courts ended scrip systems; join and fund worker organizations in peacetime — they are the only help that exists at the moment of the dispute itself.	42%	70%	Enforce the 2-of-4 lever cap (job/housing/food/credit); fund labour inspection per worker; portable insurance attached to the person.
41	Work & Livelihood	Now	Precarious gig work, credential inflation, and regional job deserts leave large populations one missed paycheque from crisis.	Document your hours and pay independently (photos of schedules, a personal log) — wage claims are won on worker records; keep a portable proof-of-skills file; build the 3-month reserve before any lifestyle upgrade.	Claim unpaid wages through labour boards (free, no lawyer needed in most jurisdictions), benefits pro-rated by law, employment-insurance equivalents, and retraining programs; gig workers: worker centres and unions increasingly represent contractors — ask.	55%	76%	Pro-rate benefits per hour across all contract types; automatic regional diversification triggers at the 20% single-employer threshold; personal 3-month reserve as the household standard.
42	Work & Livelihood	Future	Machines take the majority of paid tasks; the link between contribution and income breaks entirely.	Move early toward ownership and irreducibly human work; treat every job as training you are paid for, and extract the credential, the portfolio, and the network from each one before it ends.	Claim transition accounts and wage insurance the moment displacement is announced (funds deplete), and negotiate collectively — severance, retraining, and ownership conversions happen at tables individuals are not invited to.	28%	50%	Start citizen funds now from automation rents; convert large employers progressively to shared-ownership forms; phase hour reductions by measured sector displacement.
43	Transport & Mobility	Past	Transport failure starves cities: pre-industrial capitals depended on daily food convoys that war, weather, or blockade could sever in days.	Keep your own mobility: a bicycle, a cart, animals where apt, and food stores meant you were never fully besiegeable; know two routes out of your district on foot.	Claim evacuation transport and relief convoys through municipalities and relief bodies; register vulnerable household members (elderly, disabled) on evacuation-assistance lists before emergencies — most cities keep them and few citizens know.	48%	72%	Two independent modes for food and fuel per city; 30-day urban food reserves; bypass capacity of 60% pre-planned for critical links.
44	Transport & Mobility	Now	Car-dependent sprawl plus fuel and parts chokepoints make daily life brittle; one closure or price spike strands millions.	Don't let one mode own you: a bicycle plus transit pass plus walking fitness covers most urban life at a fraction of car cost and none of its chokepoints; households with cars: never below a quarter tank during storm and unrest seasons.	Claim transit subsidies and passes (low-income passes exist in most large cities), community shuttle and paratransit services (bookable, subsidized, underused), and cycling infrastructure through participatory budgets — citizens propose and win these routinely.	58%	76%	Cap any single mode/route at 40% of essentials; apply the 15-minute standard to all new development; 6-month operating reserves for transit.
45	Transport & Mobility	Future	Autonomous, electric, platform-controlled mobility concentrates failure: one software fault, cyberattack, or battery-material cutoff grounds a continent.	Choose vehicles and services with manual fallback and multiple providers; keep the bicycle — it is the only transport technology in this file that no update can brick.	Claim consumer-protection and accessibility standards through regulators: file the complaint when a platform's failure strands you; aggregated complaints are what change certification rules.	38%	58%	Two independent software stacks per region by certification rule; manual drive retained in every autonomous vehicle; annual no-network drill day.
46	Communication	Past	Communication monopoly or collapse isolates populations: empires fell in regions where news took months; rumour governed.	Maintain your own channels: letters, couriers, congregations, and meeting places moved true information under every monopoly; agree family rendezvous points and message drops in advance of any crisis.	International mail, exile press, and later shortwave broadcasts; faith and diaspora networks carried messages across closed borders for centuries — membership in one is a peacetime asset.	45%	66%	Maintain broadcast, print, courier, and digital in parallel; municipal emergency broadcast reaching all residents within 1 hour, off-grid capable.
47	Communication	Now	Platform dependence: a handful of companies carry the world's speech, identity, and emergency communication; outages and bans silence millions instantly.	Own your list: export your contacts and records monthly, keep one channel you fully control (your own email list, phone tree, or radio net), and print the essential numbers — a dead phone should not erase your network.	Claim portability and appeal rights where legislated; public libraries provide free internet, printing, and help with forms and accounts in most cities — a staffed, free, walk-in route around platform lockouts.	62%	78%	Own your lists off-platform (monthly exports); keep one fully controlled channel per organization and household; statutory appeal rights for account termination.
48	Communication	Future	Total surveillance or total encryption-war makes private communication impossible — or, inversely, untraceable coordination makes law enforcement blind to real conspiracies.	Use encrypted channels for private communication as your default, keep devices updated, and teach the household the difference between private speech (protect) and public amplification (verify provenance first).	Claim your legal rights in writing: data access, correction, and surveillance-disclosure requests have statutory deadlines in many jurisdictions; organizations (civil-liberties groups) file template requests free.	38%	58%	Protect end-to-end encryption in law; every surveillance power sunsetted at 5 years with published annual accounting; individualized warrants only.
49	Demographics & Population	Past	Population collapse from plague, war, and famine unmakes societies: fields untilled, cities abandoned, knowledge lineages cut.	Skills redundancy inside the family: teach every critical household skill to at least two people; keep written family knowledge (recipes, remedies, trades, records) — lineages that wrote things down restarted faster after every catastrophe.	Claim relief and resettlement through whatever authority exists, and register births, deaths, and marriages even in chaos — the documents are the family's claim on every future program.	45%	66%	Duplicate every critical skill across 2+ lineages and regions; relief triggers declared in law in advance; no critical profession 40%+ in one metro.
50	Demographics & Population	Now	Below-replacement fertility plus rapid aging inverts the pyramid: fewer workers support more retirees; towns hollow out.	Form the support structure deliberately: multi-generational and chosen-family households pool housing, childcare, and eldercare at costs no market matches; the household is the demographic unit citizens actually control.	Claim family benefits, childcare subsidies, parental-leave top-ups, housing sized for families (waitlists move for those who apply early and update files), and pension credits for caregiving years — unclaimed in large numbers.	50%	68%	Family housing at the 30% benchmark in city plans; childcare under 10% of median income; automatic pension balancing so adjustment is gradual, not crisis-driven.
51	Demographics & Population	Future	Divergent futures collide: some regions depopulate to non-viability while others add billions; unmanaged flows destabilize both.	Decide with the 50-year map, not this year's fashion: where your grandchildren can live, work, and be cared for is a family decision made by today's location, savings, and citizenship choices (including second passports where lawfully available).	Claim mobility rights early: citizenship-by-descent, residency pathways, and credential recognition are slow systems — start them years before you need them; diaspora networks are the practical guide.	30%	52%	50-year demographic annex in every national plan, updated 5-yearly; mobility compacts negotiated before flows peak; infrastructure sized to the projection band.
52	Justice & Ethics	Past	Justice systems become weapons: show trials, collective punishment, and law as an instrument of terror.	Evidence and exit: document abuses with dated, duplicated records held outside the jurisdiction, comply outwardly where survival requires while preserving the record, and leave when the record shows the pattern is structural, not episodic.	International courts, tribunals, and asylum systems run on documented evidence; human-rights organizations archive citizen records free and safely — the archive is the claim.	28%	52%	Judicial tenure, salary, and budget protected constitutionally; forensic methods validated before courtroom use; wrongful-conviction compensation automatic.
53	Justice & Ethics	Now	Two-tier justice: the wealthy buy delay and expertise; the poor plead guilty to get out of jail; backlogs make 'justice delayed' the norm.	Know your rights in writing before you need them (arrest, search, tenancy, employment, consumer); record interactions lawfully; never sign under pressure without advice; small claims and tribunals are designed for citizens without lawyers — use them.	Legal aid, duty counsel, law-school clinics, and ombudsmen are free routes that exist in most democracies; human-rights commissions accept complaints at no cost; day-fine and fee-waiver systems require only that you ask with documentation.	52%	74%	48-hour detention review; day-fines scaled to income; legal aid at parity in criminal matters; monthly publication of waits and outcomes.
54	Justice & Ethics	Future	Algorithmic justice and predictive policing automate bias at scale; people are punished for probabilities, and no human is answerable.	Score hygiene: know what data the state and platforms hold on you, correct errors within the statutory window, and demand human review of any automated decision that touches your liberty, credit, or livelihood — in writing, creating the record.	Claim audit and appeal rights under AI and administrative law; civil-liberties organizations run test cases — a documented individual case is often the vehicle that changes the rule for everyone.	40%	60%	No liberty decision on algorithmic score alone; models public and disparity-audited; every scored person can see, correct, and appeal to a human within 30 days.

#	Identity Status	What Changes	Specific Barriers	Routes With Help That Exist	Strategy Without Any Help	Probability Shift vs. Base	How to Maximize
1	Citizen — majority group	Full legal standing: vote, claim all programs, sue, organize, move freely. Your probabilities in the playbook apply as printed.	Complacency and information gaps — most under-claiming in rich countries is by fully entitled citizens who never apply.	Every route in this file: benefits, legal aid, ombudsmen, elected representatives, courts, media.	The full playbook applies directly; your constraint is attention, not permission.	+0 (baseline)	File taxes annually (benefits key off returns), register to vote, and keep the documents folder current — baseline citizens lose most by paperwork, not by exclusion.
2	Citizen — racial / ethnic minority	Same legal rights on paper; in practice: higher rates of ID checks, service refusal, hiring and housing discrimination, and disbelief by officials.	Discrimination at counters and in algorithms; language profiling; records and complaints dismissed more often — countered by documentation and collective filing.	Human-rights commissions (free complaints), employment-equity and anti-discrimination law, minority legal clinics, community organizations that file pattern complaints; in Canada: the Human Rights Commission and provincial tribunals.	Document every refusal in writing (date, name, words used), bring a witness or advocate to critical appointments, and file the complaint even when you expect little — pattern evidence is built from individual filings.	-8 points on institutional routes; 0 on self-help routes	Never rely on one official's word: get decisions in writing, appeal by default, and route claims through organizations that track outcomes by group.
3	Citizen — religious minority	Rights formally equal; risks concentrate in dress, diet, worship space, and holidays — permits and accommodation are the battlegrounds.	Zoning resistance to worship spaces, accommodation refusals at work and school, hate incidents rising in crisis periods.	Religious-freedom provisions in human-rights codes (duty to accommodate to undue hardship), interfaith councils, legal-defense funds maintained by faith communities.	Keep worship and mutual aid organized at congregation scale — historically the most durable minority infrastructure; document incidents and report collectively.	-6 points on institutional routes	Know the accommodation standard in your jurisdiction word-for-word and request accommodations in writing, early, and reasonably — written reasonable requests are what tribunals protect.
4	Citizen — linguistic minority	Services, courts, and ballots may not exist in your language; every system costs you extra time and error risk.	Forms, hearings, and medical care in the majority language only; interpreters scarce outside big cities.	Official-language rights where they exist (in Canada: federal services in English/French; court interpreters are a right in criminal matters), settlement and community interpreters, translated materials from libraries and NGOs.	Build a bilingual documents folder (your vital records translated and certified), identify two bilingual advocates in your network, and use written communication (translatable) over phone calls.	-7 points where services are unilingual; 0 where language rights are enforced	Request the interpreter formally in advance for every official appointment — the request creates the record; its absence creates your appeal.
5	Indigenous peoples (within states)	Distinct legal position: treaty and constitutional rights, self-government in some regions, and dedicated services — alongside the deepest documented service gaps.	Jurisdictional buck-passing (federal vs. provincial/state) delays care and funding for years; remote infrastructure deficits.	Treaty and constitutional rights enforcement, Indigenous-led health, legal, and child-welfare authorities, Jordan's Principle in Canada (the child first, governments argue later — claim it by name), land-claims and specific-claims processes.	Community-owned infrastructure (water, housing, stores) and Indigenous knowledge systems are primary resilience, not supplements; document service refusals for Jordan's-Principle-style claims.	-10 on state-delivered services; +5 on community-controlled routes	Claim through Indigenous-led organizations first where they exist; put every jurisdictional refusal in writing — the paper trail is what wins the systemic cases.
6	Permanent resident / settled immigrant	Near-full access to services, work, and benefits; no vote; status can be lost by long absence or serious criminality.	Credential non-recognition (the doctor driving a taxi), employer exploitation tied to unfamiliarity, fear of jeopardizing status by complaining.	Settlement agencies (free: language, employment, credential navigation), credential-recognition and bridging programs, labour boards (they protect residents equally), permanent-resident legal clinics.	Get credentials assessed in the first year, keep residence days documented, and join professional associations early — networks, not applications, produce commensurate jobs.	-5 points overall; -15 on first employment match	Never pay private 'immigration consultants' for what settlement agencies do free; verify any adviser against the official regulator's register.
7	Refugee (recognized)	Protection status with work rights and most services; family reunification possible but slow; travel documents replace the home passport.	Trauma, interrupted education, no local references, family still in danger abroad consuming income and attention.	UNHCR and state resettlement systems, refugee legal aid, dedicated health and trauma services, private/community sponsorship programs (Canada's model: groups sponsor and support for a year), protected-person benefit streams.	Sponsorship and community networks are the fastest route to housing, work, and language; document your story once, well, with counsel — consistency across years of files protects status.	-8 points; higher in the first 2 years, converging after	Take the language program to completion before full-time survival work if benefits allow — the lifetime earnings difference is the largest single variable you control.
8	Asylum seeker / claimant (status pending)	Legality is provisional: work permits often delayed, benefits minimal, and every service interaction carries status anxiety.	The wait itself — months to years without decision; detention risk in some jurisdictions; exploitation by employers and landlords who know your options are thin.	Refugee legal aid (in Ontario: Legal Aid Ontario certificates for claimants), claimant support organizations, church and NGO shelters and food programs that serve regardless of decision status, UNHCR guidance.	Keep every document, attend every hearing, report address changes exactly as required — most failed claims fail on procedure and absence, not on the merits.	-18 points on institutional routes	Get a real lawyer or accredited representative at the start, not after a refusal; free claimant clinics exist in every major receiving city — find yours in week one.
9	Internally displaced person (IDP)	Displaced inside your own country: legally a citizen, practically a stranger — local services tied to a home district you fled.	Registration systems that require documents left behind; host communities resenting competition for housing and work; no international protection mandate as strong as refugees'.	National IDP registration and aid, IOM and Red Cross/Red Crescent operations, camp and host-community programs; your citizenship still entitles you to vote and claim — demand re-registration in place.	Travel and store documents digitally (photos in cloud + with a trusted person elsewhere); community-of-origin networks in the host city are the first real infrastructure.	-15 points	Register everywhere registration exists (aid lists, voter rolls, school enrolment) — in displacement, being counted is the master key to every other route.
10	Stateless person	No state recognizes you as a citizen: no passport, often no legal work, no consular protection anywhere; children may inherit the condition.	Invisibility to systems built on nationality fields; detention for 'removal' to a country that will not take you; birth registration denied to your children.	UNHCR statelessness mandate and statelessness determination procedures (exist in a growing list of countries), legal-aid NGOs specializing in nationality law, birth-registration campaigns — a birth certificate is the first crack in the condition.	Preserve every scrap of evidence of birth, residence, and ancestry (school, clinic, religious records); community attestation letters have legal weight in determination procedures.	-30 points — the hardest status in this file	Target the determination procedure and children's registration first; one recognized document compounds into work rights, travel papers, and eventually naturalization.
11	Undocumented / irregular migrant	Present and working, but without legal status: most formal routes are closed or dangerous to approach; your labour is wanted, your personhood is not recognized.	Fear of detection at every counter; wage theft with no safe complaint route; no insurance; medical care delayed until emergencies.	Firewalled services where they exist (many cities' clinics, schools, and food programs do not ask status; sanctuary-city policies vary — verify locally), migrant-worker centres, consulates of your home country, regularization/amnesty programs when announced (apply immediately; windows are short).	Cash discipline, trusted-network housing and work, skills and savings portable across borders, and children enrolled in school wherever schooling is status-blind — education is the family's bridge asset.	-35 points on institutional routes; self-help routes unaffected	Never pay smugglers or 'fixers' with your documents or your family's location; keep copies of everything with a trusted person; learn precisely which local services are firewalled from enforcement — that map is life-critical knowledge.
12	Temporary migrant worker	Status tied to one employer: housing, income, and legality hang on a single relationship — the company-town pattern in modern form.	Complaint means dismissal means deportation; recruitment-fee debt from home country; contracts substituted on arrival.	Worker-support organizations and hotlines (in Canada: migrant worker support networks and open work permits for vulnerable workers — a real, claimable remedy), embassies' labour attachés, unions in some sectors.	Keep your passport (employer holding it is illegal in many jurisdictions — and a red flag), photograph your contract and pay records, save the exit fund before anything else.	-20 points while tied; normalizes on open permits	Learn the abuse-report route that does not require your employer's knowledge, and connect with the worker centre in your first month, not your worst month.
13	International student	Status for study, limited work hours, high fees, no safety net designed for you; families at home are your insurer of last resort.	Work-hour caps vs. living costs; housing scams targeting newcomers; mental-health strain far from support networks.	University legal, immigration, and emergency-bursary services (real and underused), student unions' food and housing programs, regulated work rights — report employers who demand unpaid 'trial' shifts.	Choose housing through the university's verified lists, keep the emergency fund untouchable, and treat the study permit's conditions as hard law — status errors compound for years.	-10 points on income routes; education routes full	Use campus services aggressively — you prepaid for them in your fees.
14	Woman under a legally restrictive regime	Guardianship and mobility laws may require male permission for travel, work, documents, and medical decisions; your legal personhood is partial by statute.	Every official route runs through the guardian; exit itself may be the problem before any other problem can be solved.	Women's shelters and legal networks (often discreet), international attention in documented cases, asylum on gender grounds (recognized in many jurisdictions' law), UN Women and regional bodies' reporting channels.	Documents, money, and skills under your own control to the maximum the environment allows; trusted women's networks are the historical infrastructure of survival under these regimes.	-25 points on official routes; varies sharply by country	Prepare quietly and completely before any confrontation with the system: documents copied and held by a trusted person abroad, funds accessible, route researched — timing and secrecy are the strategy.
15	LGBTQ+ person in a criminalizing jurisdiction	Your identity itself is an offence in 60+ jurisdictions: every interaction with the state is a risk, and blackmail is endemic.	Police as threat rather than protection; family expulsion; medical care avoided or dangerous; digital surveillance of apps and messages.	Underground and exile support networks, international LGBTQ+ organizations with secure contact channels, asylum on sexual-orientation/gender-identity grounds (established in Canadian, EU, US, and other law).	Digital hygiene as survival: device security, compartmented identities, trusted-person check-ins; community knowledge of safe people and places, transmitted carefully.	-25 points on state routes; community routes are the main line	Plan exit as a project (documents, funds, destination law researched) rather than an impulse; preserve evidence of persecution — it is the substance of an asylum claim.
16	Person under caste-based status	Hereditary occupational and social rank enforced socially (and in places violently) even where law forbids it: services, water, temples, and justice rationed by birth.	Local power structures enforce the hierarchy the constitution abolishes; complaints routed to the oppressors themselves.	Constitutional protections and specific atrocity-prevention law (e.g., India's SC/ST Act), caste-oppressed communities' political and legal organizations, reserved seats and quotas in education and employment — claim every reserved entitlement in writing.	Education is the historically proven exit; prioritize schooling ruthlessly, migrate for work where anonymity is possible, and build assets the village hierarchy cannot ration (skills, savings, city networks).	-15 points on local institutional routes; national routes closer to baseline	Route claims to the highest level of authority available — local capture is the pattern; district and national bodies, and courts, are structurally more neutral.
17	Person in occupied / contested territory	Two authorities may claim you and neither fully serve you; movement permits govern work, care, and family life; documentation is a weapon used by all sides.	Checkpoints, permit denials, service systems split by status category; records destroyed or held by a hostile authority.	International humanitarian law protections, ICRC and UN agency services, legal-aid organizations specializing in permits and family unification, meticulous personal documentation of every denial.	Duplicate every document outside the territory; maintain skills and savings portable across a border; community institutions (schools, clinics, cooperatives) are the functioning state — invest in them.	-20 points	Paper is protection: every permit application, denial, and incident recorded and copied abroad; the archive outlives the checkpoint.
18	Prisoner / detained person	The state controls your food, movement, health, and communication; your problems are solved by others' permission or not at all.	Grievance systems run by the detaining authority; health care rationed; family contact fragile; retaliation risk for complaints.	Prisoner-rights law and inspection bodies (ombudsmen, OPCAT national mechanisms where ratified), prison legal clinics, family and faith visitation networks, ICRC detention visits in armed conflict.	Conduct record and program participation are the currency of every internal decision (parole, privileges, transfers) — manage them deliberately; keep your outside documents and relationships alive by letter.	-30 points on most routes	Use the official grievance and inspection channels in writing even when sceptical — the record is what external lawyers and inspectors later act on.
19	Former prisoner / person with a criminal record	Sentence complete, consequences permanent: employment, housing, licensing, and travel rationed by the record.	Background checks as automatic rejection; disclosure dilemmas; supervision conditions that make ordinary life a compliance minefield.	Record-suspension/pardon processes (in Canada: Parole Board record suspensions), ban-the-box and fair-chance hiring employers and laws, expungement legal clinics, halfway and employment programs for returning citizens.	Target employers and landlords who assess individually (small businesses, trades, union halls); build a documented post-release record (work, volunteering, references) that answers the check with evidence.	-15 points on employment and housing routes	Start the record-suspension clock and paperwork at the earliest eligible date; the waiting period is fixed, so the only variable is when you begin.
20	Child / minor	No independent legal standing: every route runs through adults or the state; your consent is not legally required for most decisions about you.	Dependence on the very adults who may be the problem; systems that hear the file, not the child.	Child-protection services, school counsellors (mandatory reporters — telling one starts a legal process), children's helplines (Kids Help Phone in Canada, Childhelp in the US, Childline in the UK — free, confidential, no parental permission needed), children's advocates/ombudsmen in many jurisdictions.	Tell a mandated adult outside the home (teacher, coach, doctor) — that single act activates machinery you cannot activate alone; keep a trusted adult in another household who knows your situation.	-20 points until a mandated adult is engaged; then institutional routes engage fully	The helpline call is the master move: anonymous, free, and it creates the record that obliges the system to act.
21	Nomadic / itinerant peoples	Services, schooling, and voting are built on fixed addresses you do not have; movement itself is treated as non-compliance.	Address requirements on every form; encampment evictions; children's schooling interrupted by design.	Address-free service provisions where legislated (care-of addresses, library and shelter addresses accepted in some jurisdictions), mobile clinics and schools, cultural-rights protections.	Keep identity and vehicle/encampment documents impeccable — your encounters with authority go better with paper; community stopping places and networks carry the practical knowledge.	-15 points on address-gated services	Establish one anchor address (relative, organization, post box where accepted) and route all official life through it.
22	Descendant of enslaved / historically dispossessed groups	Formal equality over inherited deficit: wealth, land, and network gaps created by law over centuries and transmitted by inheritance arithmetic.	Intergenerational wealth gap compounds in housing and education markets; documentation of ancestry and claims fragmented by the original dispossession.	Reparations and land-back processes where they exist, tribal and community land trusts, targeted scholarships and business programs, genealogy and archives projects that rebuild the paper record.	Asset-building inside the community (cooperative ownership, land trusts, pooled investment) converts individual gains into inheritable position — the mechanism the original theft interrupted.	-8 points on wealth-accumulation routes	Claim every targeted program in writing and on time — these programs are the partial repayment of a documented debt, not charity.

#	Condition	What Changes	Specific Barriers	Routes With Help That Exist	Strategy Without Any Help	Probability Shift vs. Basel	How to Maximize
1	Poverty / no savings	Every solution's cost floor becomes the binding constraint; you solve in labour and cooperation what others solve in money.	Fees, deposits, transport costs, and time off work price you out of 'free' programs.	Fee waivers (ask — most programs have them unadvertised), benefits and credits (file taxes to unlock), food and clothing banks, community legal and health clinics scaled to income.	Barter, buying clubs, repair skills, library everything (books, tools, internet, courses); your currencies are time, skill, and reliability — invest them visibly.	-15 points on cost-gated routes	Claim in this order: income benefits, food, housing stability, health coverage, then everything else — the pyramid in that order because each unlocks the next.
2	Homelessness / no fixed address	Address-gated everything; ID, benefits, jobs, banking all presume the thing you lack.	No mail, no storage, no sleep security; belongings repeatedly lost to sweeps and theft, including documents.	Shelter and housing-first programs (housing without preconditions — the evidence-backed model), ID replacement clinics and document-recovery services, address services at shelters and libraries, outreach health teams.	Document survival first: photos of every ID document stored in the cloud and with a trusted person; one bag, always with you, with the irreplaceables.	-25 points until housed; housing-first restores most of it	The single highest-leverage act is a housing-first application plus ID recovery, in parallel, this week — every other probability in your life is downstream of those two.
3	Disability — physical	The built environment and service design assume a body you do not have; every route has an accessibility toll.	Inaccessible offices, transport, and housing; benefit systems that make you prove incapacity repeatedly; employer reluctance.	Disability benefits and tax credits (in Canada: ODSP, DTC, CPP-D), accessibility law (duty to accommodate), paratransit, assistive-device programs, disability legal clinics.	Energy budgeting as a discipline (spend your capacity like money, on the highest-value actions), remote and asynchronous everything where possible, and a support roster built before crises.	-12 points; partially offset by dedicated programs	Get the diagnosis and functional assessment documented once, thoroughly — every program keys off that paper; a strong file pays out for decades.
4	Disability — cognitive / intellectual	Systems are designed for people who can parse forms, deadlines, and appeals — the exact functions your condition taxes.	Complexity as exclusion; benefits lost to missed letters, not ineligibility; exploitation by people who 'help' with money.	Supported decision-making and representative services, disability case workers, plain-language services (request them — a right in many systems), trusted-person arrangements with safeguards.	One-page personal systems: a wall calendar, a documents folder, one named helper for paperwork — external structure substitutes for taxed functions.	-15 points on paperwork-heavy routes	Authorize a trusted advocate formally; an advocate with standing converts your probability to near-baseline on administrative routes.
5	Mental illness	Episodic capacity: you may be fully capable in March and unable to open mail in April; systems punish the gaps, not the illness.	Stigma at counters and in families; service access worst exactly when symptoms peak; records that follow you.	Public mental-health services, crisis lines (Canada 988; Hope for Wellness), peer-support organizations (lived-experience staff), disability benefits where illness is disabling — episodic documentation wins claims.	Pre-commitment planning while well: a written crisis plan (who to call, what helps, hospital preferences, who handles bills) given to two trusted people — your well self instructs your unwell self's care.	-12 points during episodes; near-baseline between with a plan	The crisis plan and the advance paperwork are the whole game: decide everything decidable while you are well.
6	Chronic illness	Treatment is a second job: appointments, medications, insurance fights, and energy limits consume the capacity other solutions require.	Medication costs, specialist waitlists, employers who count absences not output.	Drug-benefit programs (in Ontario: Trillium for high drug costs relative to income), disease-specific foundations (many fund equipment, travel, and drugs), hospital social workers — ask for one by name.	Batch and routinize the medical admin (one pharmacy, synced refills, one records folder), and protect sleep and infection-avoidance as core treatment, not lifestyle.	-10 points	A hospital social worker and a disease foundation together cover most gaps — two phone calls unlock a disproportionate share of what exists.
7	Elderly / frail	Fixed income, declining mobility and senses, and systems migrating online faster than you do — plus being the prime target of fraud.	Digital-by-default services; transport gaps; bereavement collapsing the two-person household system into one.	Seniors' benefits and supplements (in Canada: OAS/GIS — GIS is under-claimed by eligible seniors), seniors' centres (meals, help with forms, social infrastructure), home-care and falls-prevention programs, elder-abuse hotlines.	Fraud protocol (no decision on the spot, ever; verify by family code word), one-floor living arrangements, and documents + powers of attorney executed while fully capable.	-10 points on digital routes; benefits routes often easier than for the young	Powers of attorney and an updated will are the highest-leverage documents in this entire file for this condition — do them while there is no question of capacity.
8	Youth / student	High capability, no assets, no credit, no standing — and decisions (debt, programs, records) whose costs run for decades.	Student debt instruments signed at 17; housing and food insecurity hidden by pride; inexperience priced by every market.	Student aid and bursaries (apply for all, including the obscure ones), campus food banks and emergency funds, youth employment programs, co-op and apprenticeship routes that pay instead of charging.	Choose the program by its employment outcomes, not its brand; work in your field from year one even unpaid-short-term; keep total debt under one year's expected starting salary.	-8 points on asset routes; education routes full or better	Your scarcest asset is uncommitted time — spend it on the credential plus the portfolio plus the network, in that combination, and the probability table inverts within five years.
9	Single parent / sole caregiver	Time is the binding constraint: every solution competes with childcare, and there is no second adult to parallel-process a crisis.	Programs scheduled as if a spare adult exists; childcare costs consuming the wage the program was meant to supplement.	Childcare subsidies (apply before you need the spot — waitlists are the system), child benefits (in Canada: CCB, substantial and under-claimed by non-filers), family legal aid, caregiver and respite programs.	Trade childcare in a fixed circle of 2–3 families (reciprocity beats cash), batch all administration into one weekly block, and build the village deliberately — isolation is the risk, not singlehood.	-12 points on time-heavy routes	Childcare first: the subsidy and the spot unlock employment, education, and rest — every other application's probability rises once care is solved.
10	Pregnancy	A hard deadline governs everything: benefits, housing, work safety, and medical care all change meaning across 40 weeks.	Work exposures and income interruption; housing discrimination (illegal, common); care deserts in rural areas.	Prenatal programs and midwifery/primary care (enrol in the first trimester — panels fill), parental benefits, pregnancy-specific food and housing programs, workplace accommodation duties.	Register with a care provider and a benefits plan in the first trimester even before telling employers; the paperwork calendar is the controllable variable.	-5 points; dedicated programs partially offset	First-trimester registration is the master move — it sequences every later claim correctly.
11	Illiteracy / low literacy	Every system in this file is text-gated; the condition is invisible and shame hides it, so help is rarely requested in usable form.	Forms, contracts, medication labels, ballots; dependence on readers who may exploit it.	Adult literacy programs (free, confidential, in libraries and community centres everywhere), audio and in-person service channels (request them — often a legal accommodation), legal protections: contracts you could not read are challengeable in many systems.	Use voice everything (voice notes, text-to-speech, call instead of write), photograph documents and have a trusted reader on call, and mark your calendar by pictures/symbols — self-built systems work.	-18 points on text-gated routes	One literacy program enrolment changes every other number in your row permanently — it is the only intervention in this file that raises all future probabilities at once.
12	Language barrier (newcomer language)	Functionally similar to illiteracy but temporary: your competence is intact, the interface is foreign.	Every negotiation happens at a disadvantage; children become interpreters (harmful and unreliable); scams target the barrier specifically.	Free language instruction (in Canada: LINC and equivalents in most OECD countries), settlement workers in schools and libraries, telephone interpretation in hospitals and courts — request it, it is a right in critical settings.	Learn the 200 highest-frequency administrative words first (the vocabulary of forms, clinics, and leases), and never sign what has not been interpreted by a neutral party.	-15 points, decaying to baseline as language grows	Language class is not one program among many; it is the multiplier on every other route — protect its hours against work pressure.
13	Digital exclusion (no device / connectivity / skills)	Governments and banks are closing the physical doors; without digital access you are routed to queues that no longer exist.	Two-factor authentication assumes a phone; benefits, jobs, and appointments are portal-only; cash acceptance shrinking.	Library computers and staff help (free, patient, in-person — the great underused route), community digital-literacy programs, device-lending programs, legal rights to non-digital channels in some jurisdictions (request paper/phone service explicitly).	One reliable access point used on a schedule (library day) plus a paper master file (numbers, passwords stored safely offline with a trusted person) covers most needs without owning a device.	-15 points on portal-gated routes	A library card plus one weekly library session is a complete digital-access strategy — build every routine around that anchor.
14	Rural / remote / off-grid	Distance is the tax on everything: specialists, courts, parts, and programs are hours away and weather-gated.	Service deserts; broadband gaps; one road, one store, one employer towns; emergency response measured in hours.	Tele-services (health, legal, education) where connectivity exists, mobile and circuit services (courts, clinics that travel), rural subsidies and northern allowances, mail-order and cooperative buying that pools the distance cost.	Stock deeper than city households (30–90 days is the rural norm, not prepper excess), maintain your own repair capacity and tools, and never let the vehicle fall below half a tank in winter.	-10 points; self-reliance routes often higher than urban	Your community network is infrastructure: the neighbour with the tractor, the nurse two concessions over — invest in those relationships as deliberately as in supplies.
15	Active addiction	The condition consumes the reliability every system demands: appointments, abstinence conditions, paperwork — while withdrawal and craving run the clock.	Programs requiring abstinence before help (housing, treatment) invert the evidence; stigma converts treatable illness into moral exile.	Harm-reduction services (needle exchanges, supervised consumption, naloxone — free and anonymous), housing-first (no abstinence precondition), addiction medicine (methadone/suboxone through regular clinics), peer recovery programs.	Carry naloxone if opioids are anywhere in your environment; use with a person present or a spotting service; keep the using environment as safe as the habit allows — survival first, recovery on survival's foundation.	-20 points on condition-gated routes; harm reduction is unconditional	Housing-first plus a regular clinic are the two doors that do not require you to be well before entering — find those two first.
16	Survivor of violence / trafficking	The danger may be ongoing and the perpetrator may control documents, money, children, and information — solving anything else first is impossible.	Systems that require the perpetrator's cooperation (joint accounts, shared housing, family court contact); disbelief; trauma responses read as unreliability.	Shelters and transition houses (addresses confidential, entry by phone), protection orders, victim-link and trafficking hotlines (in Canada: 1-833-900-1010 for trafficking), legal aid for family and immigration matters, hospital-based violence programs.	Safety plan before system contact: documents photographed and held by a trusted person, a go-bag outside the home, a code word with neighbours and children, and routes rehearsed — the plan precedes the paperwork.	-20 points while danger is active; shelter entry resets much of it	The shelter/hotline call is the master move: one call connects legal, housing, money, and safety planning through people who do it daily.
17	Social isolation (no network)	No one to witness, co-sign, drive, lend, vouch, or notice — most informal systems in this file run on relationships you do not currently have.	Programs assume an emergency contact; crises are discovered late; loneliness itself degrades health and judgment.	Friendly-visiting and check-in programs, seniors' and community centres, faith and cultural communities (membership precedes belief for many), volunteer roles — volunteering is the fastest legitimate network-builder available to anyone.	One recurring scheduled presence (same class, congregation, club, shift, weekly) converts strangers to weak ties to strong ones on a predictable curve — attendance is the entire technique.	-12 points on network-dependent routes	Join exactly one recurring thing and attend eight consecutive times before judging it — network formation is a dosage effect.
18	Mixed-status household	One family's members hold different statuses: the citizen child's benefits are unclaimed because the undocumented parent fears the counter.	Public-charge fears and rumours; one member's enforcement risk governs everyone's behaviour.	Firewalled services and legal advice specific to mixed families (immigration legal clinics give this counsel free and confidentially); citizen members' entitlements are legally independent — claim them with counsel's letter in hand.	Assign the documented members as the household's interface with every system, and keep the family's documents organized so any member's status event does not destroy the whole file.	-12 points household-wide	One session with an immigration legal clinic to map exactly which claims are safe — the map replaces fear with a list.

Pareto Rank	Vital Action	Cost Tier	Time Required	What It Unlocks	Problems It Imp	Why It Ranks Here
1	The documents folder: ID, property, qualifications, medical and insurance records — originals protected, copies on paper, copies photographed and held by a trusted person in another place	$0	One weekend	Every claim, benefit, asylum case, insurance payout, and job application in this file runs on documents; their absence is the #1 cause of failed legitimate claims	54	It touches all 54 problems and is free. Nothing else in this file has a 54/54 reach at $0.
2	File taxes every year, even with zero income	$0	1–2 hours/year	Benefits, credits, childcare subsidies, pension contributions, and program eligibility key off the return in most systems	21	The state cannot pay a person it cannot see. Non-filing is the largest single cause of unclaimed money.
3	Register and claim: benefits audit — list every program you might qualify for and apply to all of them in one month	$0	One month of evenings	Income floor, food, drug coverage, housing supplements, transit passes — the stack compounds	24	Under-claiming by eligible people is measured in the billions per country per year; the audit converts eligibility into income.
4	Get a library card and learn its full service list (internet, printing, courses, meeting rooms, staff help with forms)	$0	One visit	Digital access, education, job search, knowledge redundancy, and a staffed human help desk — free	18	The library is the only institution in this file that substitutes for money across education, communication, digital exclusion, and information at once.
5	The 72-hour household kit + 30-day staple buffer, built gradually (one extra staple item per shopping trip)	Low (<$150 total)	Built over 1–2 months	Water, food, light, heat, medication continuity through the first phase of any infrastructure failure	14	Almost every coinciding scenario in the master file is survivable or fatal in its first 72 hours; the buffer buys the time in which help becomes reachable.
6	One recurring in-person group, attended weekly (congregation, club, league, class, union, mutual-aid circle)	$0	1–3 hours/week	Network: witnesses, references, rides, loans, warnings, job leads, check-ins during crises — and the strongest mental-health intervention in the file	20	Network is the informal infrastructure under half the solutions in the playbook; it cannot be bought during a crisis, only before one.
7	The rights card: your jurisdiction's core rights (tenancy, employment, arrest, consumer) in plain language, kept with your documents, plus the phone numbers of legal aid, the ombudsman, and 211-equivalents	$0	One evening	Converts illegal evictions, wage theft, and service refusals from accomplished facts into contestable acts	16	Rights that are not known and invoked do not operate; the card makes invocation a 5-minute act instead of a research project.
8	Household skills redundancy: every critical skill (cooking from staples, first aid, documents admin, repair basics) known by at least 2 people; one skill course per year (first aid first)	Low (first-aid course ~$50–150)	One weekend/ year	Survival of the household system when its most capable member is ill, absent, or gone	12	Single-person dependency is the household version of a single point of failure; redundancy is the cheapest resilience there is.
9	The emergency fund, built in strict sequence: $500, then 1 month, then 3 months of expenses — in an insured account	Moderate (accumulated)	Months to years	Converts job loss, illness, and breakdowns from cascades into inconveniences; removes the desperation discount on every negotiation	15	Cash is stored options. Every coinciding-problem scenario in the master file degrades one level when a fund exists.
10	Health basics locked: vaccinations current, one regular clinic/doctor, medications list in the documents folder, dental and vision problems treated before they become emergencies	Low–Moderate	Ongoing	Prevents the health leg of every household triple-crisis; keeps work capacity intact	13	Health is the load-bearing wall: in the household triple scenario (job + illness + housing), the illness is the multiplier.
11	Second income thread: one portable skill with a portfolio (repair, bookkeeping, language, care, digital service) developed to earning level	Low (time)	6–24 months	Income redundancy; bargaining power in the main job; a bridge during displacement	11	A household with two income threads survives the loss of either; a household with one is a single point of failure with rent due.
12	Pre-registered positions: on the lists before you need them — housing waitlists, childcare subsidies, clinic panels, evacuation-assistance registries, program waitlists	$0	One month of applications	Queue position is an asset that costs only foresight; in crisis, the registered are served and the unregistered are counted	17	Most scarce public goods are allocated by queue, not by need at the door. Registration converts future emergencies into appointments.
NOT SOLVABLE ALONE — citizen-only probability 30% or less. Minimum help required:						
Field	Timeframe	Problem	Citizen-Only %	With-Help %	Minimum Help That Changes the Number	
Water	Future	Multi-year megadrought plus population growth makes current cities structurally water-short.	30%	58%	Municipal/ regional reuse and pricing infrastructure; citizen role is demand cuts, cooperatives, and organized claims.	
Food & Agriculture	Future	Climate-shifted growing zones plus soil loss cut yields across several breadbaskets simultaneously.	28%	55%	Public soil, breeding, and land programs; citizen role is cooperatives and preservation skills.	
Shelter & Housing	Future	Climate migration plus uninsurable regions strand populations in housing that cannot be sold, insured, or safely occupied.	30%	54%	Funded buyout/ retreat programs; citizen role is early exposure decisions.	
Security & Defense	Past	Invasion or civil war destroys the state's monopoly on force; civilians face violence with no protection.	25%	55%	International protection (asylum system); citizen role is early evacuation and documentation.	
Security & Defense	Future	Autonomous weapons and cheap drones make precision violence available to anyone, overwhelming policing built for human-speed threats.	25%	52%	Regulation of drones/ autonomous weapons + site hardening by institutions; citizen role is demand-side pressure and footprint reduction.	

Pareto Ranl	Vital Action	Cost Tier	Time Required	What It Unlocks	Problems It Imp	Why It Ranks Here
Governanc e & Law	Past	Constitutional order collapses into dictatorship through legal steps, emergency decrees, and captured courts.	30%	52%	International documentation and pressure; citizen role is the personal archive and exit timing.	
Governanc e & Law	Future	Legitimacy collapse: populations stop believing any institution, and coordination itself fails even without a dictator.	28%	50%	Institutions that can be verified locally + sortition/ assembly access; citizen role is occupying the open seats and building local proof.	
Economy & Finance	Future	Automation displaces labour faster than new livelihoods form, while wealth concentrates in owners of machines and models.	26%	48%	Ownership policy (citizen funds, benefits attached to persons); citizen role is positioning (ownership, human-weighte d skills) and claiming transition programs early.	
Technology & AI	Future	A misaligned or misused advanced AI, or total dependence on opaque systems, produces civilizational-scale failure or harm.	30%	52%	State capability governance (evaluation, liability, fallbacks); citizen role is analogue life-lines and invoking data/AI rights.	
Environme nt & Climate	Future	Tipping points cascade: ice loss, permafrost methane, ocean-circulation shifts lock in metres of sea-level rise and uninhabitable zones.	8%	38%	International emissions policy + negotiated migration frameworks; citizen role is exposure reduction and organized relocation claims.	
Work & Livelihood	Future	Machines take the majority of paid tasks; the link between contribution and income breaks entirely.	28%	50%	Collective negotiation and public distribution mechanisms; citizen role is early movement to ownership and human-irreduci ble work.	
Demograph ics & Population	Future	Divergent futures collide: some regions depopulate to non-viability while others add billions; unmanaged flows destabilize both.	30%	52%	State demographic planning and mobility compacts; citizen role is family-level 50-year decisions and early pathway applications.	
Justice & Ethics	Past	Justice systems become weapons: show trials, collective punishment, and law as an instrument of terror.	28%	52%	Institutional programs named in the WITH HELP column of the playbook.
